>> I think Rakkesh is here. You can share your screen. Okay.
1:47
Hope you are able to see the screen right?
1:50
>> Yes. So this is already uh completed session
1:56
which for the gold lokesh walk us through the in
2:02
so basically this is the goal loan journey.
2:06
So I'm explaining the like how we chat with the model. So
2:12
firstly I have uh it is asked to provide the 10 visit mobile number. So I'm
2:17
provided a mobile number.
2:20
>> Okay. after it uh it hit a tool call like it
2:25
stored the field mobile number. It showed the mobile number and uh next
2:34
and uh another tool is called that is send OTP uh which hits an API and OTP is
2:40
sent to the mobile number which I have provided and it asks to ask me to
2:45
provide the 60digit OTP which I have sent. So as I entered the mobile number
2:49
as I entered the OTP so it have uh used the verify OTP tool
2:56
again and the OTP tool will hit the API to verify that verify the OTP that has
3:01
sent and the OTP which I entered is correct or not. So after the OTP is
3:06
verified it asked to enter me the full name. So when I entered the full name
3:13
uh it used the tool to store the detail and after that it asked me to enter the
3:19
email address. So when I entered the email address it
3:24

used the store user detail tool again and to store the detail and uh it used
3:29
the send OTP tool to send the OTP to the email and asked me to enter the OTP.
3:35
So I have entered the OTP. It had verified with the verified the OTP.
3:40
After that uh it has checked the tool called get
3:45
collection status which basically checks whether all
3:49
details are collected or not. So when it is triggered it said all onboarding
3:53
meters collected. So the flow moves to the next stage.
3:56
>> So till here we are only collecting the phone number and the
4:00
>> email address and we are verifying it.
4:02
>> Yeah. Mhm. Okay.
4:06
>> So moving to the next stage. So it asked me to upload the other and pan images.
4:12
>> So simulated ones simulated other and pan images.
4:17
>> So OCR we extracted the text and we have passed into a middleware which basically
4:24
passes the OCR text into JSON and provides me a summary.
4:30
M
4:33
>> and details will be stored into the like database uh the PAN details and
4:40
other details and customer identity and address will be stored. So
4:46
after that uh we proceed to other verification and uh PAN verification.
4:53
So based on the other number the OTP is sent to the mobile number with generate
4:57
other OTP tool the ABS hit and the OTP will be sent to the mobile number. So

5:03
when we enter the OTP
5:06
>> second sorry when for the Aadhaar OTP you will hit the UDI
5:12
API is it?
5:14
>> Uh currently we are not hitting the UDI UDI we are using the simulated API.
5:20
So we have the capability
5:21
>> in this in this trace. Yes. But essentially you will hit the drive.
5:27
>> Yeah. Exactly. So we have the capabilities somewhere but for only uh
5:32
for testing and development purpose we have built our own simulator also. So
5:37
for that we only this
5:39
>> but in actual when we productionize it or give it to customer we have direct
5:45
integration with.
5:47
>> Okay. Got it. Yeah, we can go ahead.
5:53
>> So after that it asked me to give the concept to verify the pan and a link.
5:58
This is for uh NSDL verification. In this place we'll hit the NSDL but we
6:05
used a simulated API. So this store numbers will hit the API
6:10
to verify whether both parent and other are linked or not and provides a
6:15
message. So from here the flow proceeds to the
6:19
next stage. In this stage the customer has to
6:23
confirm the address like if the customer may have the current address, permanent
6:27

address or something. So for that we are uh using either Aadhaar or we have to
6:34
override with the proof upload. So currently we have Aadhaar. So we are
6:38
using Aadhaar or we can also use the proof upload also. uh that uh we upload
6:43
the proof and the OCR fields will extract it and the same process like
6:48
before other so we'll provide the address for
6:53
confirmed on other and uh we ask for the appointment ID of the customer here the
6:59
flow breaks and the flow recontinues so the customer ID uh we have asked the
7:05
appointment ID and when appointment ID is entered we'll verify and we'll ask
7:10
the preferred language the language reference is taken. So
7:17
we'll check the dube of the borrower from the details what we have collected.
7:21
We'll check the dup of a borrower. So when the borrower ddup is clear we
7:28
ask to enter the customer nominee's name. So nominees details will be
7:33
collected and nomy ddup will also be done. So
7:39
ddup will be done to nominee also through this run ddup tool. We'll hit an
7:43
API but uh to check through the database whether this nominee has already exist
7:48
or not. So normally dup also clear. So flow proceeds to the next st. So here
7:55
gold valuation. So what we do is uh we ask the customer to keep a photo of
8:03
ornament on the weighing scale and the purchase or the valuation certificate.
8:08
>> So the customer provides the ornament image on the weighing scale and the
8:14
valuation certificate he provides. So through these we'll extract all the

8:18
details required like the details will be extracted like this
8:26
and the summary will be provided through OC OR middleware we'll detect the type
8:31
of the ornament we'll detect the gross weight vision uh necklace weight and
8:36
everything will detect and we'll collect the gold item we'll store the details
8:40
into our uh database so we'll also value the fold and we'll
8:47
ask the customer whether does he have another ornament. If he does the flow
8:52
will do like that like the before one only. If he does not have the flow
8:57
proceeds. So uh if he doesn't have anything we'll
9:03
check the pledge through the
9:06
>> extracting the image data using
9:10
>> image data using the doc. Yeah, we have our own doc uh extraction also
9:17
extraction module that uh that is a parent IP one and also we have models
9:22
LLM models vision models basically
9:24
>> vision models okay
9:26
>> models we try to
9:29
>> got it and here we'll finalize the gold items
9:35
and we'll provide a description to the customer
9:41
we'll provide the schemes which will be autoloaded from the database
9:46
grouping
9:48

>> and the database database for the schemes would be from some government
9:52
site
9:54
>> there on
9:54
>> or your own
9:56
>> we have our simulated ones only not from the government side
10:00
>> okay but ideally it is from the government side
10:04
>> ideally companies would be take for example Tanish they'll have their own
10:09
data they'll have their own particular schemes and values and write.
10:14
>> Got it.
10:15
>> So these will come under business rules. So this has to be given by the client.
10:22
>> Okay. Got it. Like whatever goal certificate the client provides basis
10:27
that that company API will be I mean sorry query site will be queried.
10:33
>> Yes. Correct.
10:34
>> Got you. So the scheme will be selected by the
10:40
customer and based on the scheme the plan is the plan will be generated
10:45
through the calculate offer tool. So the offer will be calculated and the offer
10:51
will be presented to the customer. So we'll ask whether to confirm or
10:56
change where the customer can negotiate with the ROI.
11:02
H okay.
11:03
>> So if the customer enters confirm so we will confirm it and we'll calculate the

11:09
offer.
11:12
>> So next we will ask the customer uh there is a business rule that if the
11:18
loan amount is exceeding 250,000 we'll ask customer to enter his employment
11:24
type. So here we the customer about his employment type. He already is a
11:30
salaried employee. So if he is a salvied employee, we'll
11:34
ask him to upload the pay slips last 6 month 3 months paylips which will not
11:40
exceed more than 6 months like more than 6 months from now. So the
11:48
paylips data will be extracted and the summary will be provided to the agent.
11:53
So based on the summary the flow will proceed to the next stage.
12:00
So eligibility will be confirmed and the loan will be provided to the customer.
12:04
So now here uh the bureau score of the customer will be captured.
12:10
Uh basically civil score will be captured. So based on the civil score
12:15
next step uh based on civil score we'll calculate
12:20
the loan eligibility again and after that we'll confirm the loan eligibility.
12:25
Yeah, here civil score we we again can get from Equifax or whatever credit
12:30
worthiness companies that are there. For now, we just kept a simulator.
12:37
>> Got it. Okay.
12:40
>> So, moving to the next stage. Um this is closing closing stay and
12:45
disposal stage. So, this we'll ask whether the personal discussion with the
12:50

customer has already happened or not. This is bank. And this is bank facing uh
12:57
flow. So this will be asked to the bank agent only. So we'll ask the bank agent
13:01
whether the personal discussion has been completed or not. So he enters yes or
13:06
yes or no. Uh if he enters yes. So we'll run PD and GDR. So GDR is gold
13:13
description receipt. This will be tagged into the customer application ID.
13:18
So log into the application and we'll have a cooling of period waiting period
13:24
of 60 seconds. After that 60 seconds we'll check the approval.
13:30
The check approval status is done. Next KFS key fact statement will be
13:34
generated. This will contain all details uh regarding the loan. What we have uh a
13:40
document will be given to the customer and he has to sign it.
13:44
So whether the customer has accepted or not if he has accepted the bank agent
13:49
enters the accept. So next we'll generate an e-ign link. This will be
13:53
sent to the customer's mobile number. So from that the customer will read the
13:58
terms and conditions uh and we'll accept the e-ign.
14:02
After that we'll check the eign status.
14:09
Next uh we'll ask the customer about the dispersement type whether he wants an
14:13
empty or cash. If he asks electronic we'll ask him to enter the account
14:20
number and also the IFSC code. So from that we'll uh allocate the
14:29
packet uh which is empty and the packet after packet is allocated we'll disperse
14:34
the amount and the sanction in the end sanctions letter will be sent to the

14:37
person. So this is how basically the gold flow will go on journey will be
14:44
>> yeah correction here. So dispersement doesn't happen through agent. Uh
14:50
dispersement finally happens to the uh uh client itself like whoever is
14:56
providing this gold lo. Agent here only automates the process till providing the
15:01
soft allocation or saying that the uh applicant or whoever is a customer has
15:08
uh interest and we have captured all the details and they are eligible for this
15:12
much loan amount.
15:14
>> Payment gateway everything will be from that.
15:16
>> Yeah. Payment gateway actual transfer of money will be from the client
15:21
themselves.
15:25
>> Got it. So I think this gives you the look and
15:29
feel of how customer would be interacting. Now we would like to walk
15:33
you through the traces that we collected around this journey. Mhm. Mhm. And um
